PLEASE FORGET OUR RESULT!!

I would like to appologize that there are a fatal mistake in the proof of the algebraicity of Weil Hodge cycles. The reason is the following.

In section 3.3 Basic construction, I constructed a certain deformation of curves. But this is not what I wanted. In this proof, we choose a very ample divisor D_0 in E x C, which gives a correspondence between $H^1(E)$ and $H^1(C)$. But if D_0 is ample, $H^1(D_0)$ contains $H^1(E)$ and $H^1(C)$ independently. $H^1(E)$ can move very freely, but does not any affect on $H^1(C)$.

So please forget about the result of algebraicity.
